Assignment: Day 4

Scenario

A college keeps the records of its students, courses and enrollments in a database. The principal wants some lists prepared from this data.

Before you start

Run the setup script `college_db_setup.sql` that is shared with this assignment in Workbench. It creates the database **college_db** with three tables: **students**, **courses** and **enrollments**. You can run it again at any time to reset the data.

Tasks

1. Display the different cities the students come from.
2. Display the different departments.
3. Display the different combinations of `department` and `admission_year`.
4. Display all students from Kochi.
5. Display `first_name`, `last_name` and `percentage` of students who scored above 80.
6. Display all students who are not in the Commerce department.
7. Display all students admitted in 2023 or later.
8. Display all female students in Computer Science.
9. Display all students in Electronics or Mechanical.
10. Display all students from Kochi, Thrissur or Kozhikode.
11. Display all students who are not from Chennai, Bengaluru or Trivandrum.
12. Display `first_name`, `department` and `percentage` of students who scored 70 or more and 85 or less.
13. Display `first_name` and `date_of_birth` of students born on or after 1 January 2004 and on or before 30 June 2004.
14. Display `first_name`, `department` and `percentage` of Computer Science or Electronics students who scored above 85.
15. Display all courses that have 4 credits.
16. Display all enrollments of course 101 where the marks are 80 or more.

Submission

Add your SQL script to a GitHub repository and submit the repository link in the classroom.
